

Treasures of the soil

Made by:
Slovenian Comenius team

In Slovenia, we have 25 types of soil. The most common are brown soils.

(jerina)

One type of soil is JERINA (terarosa) and it is formed on limestone.

(limestone)

Because of this type of soil,
we've got developed wine-growing.

The iron in the soil gives the a special taste. This slovenian wine is called TERAN.

ILOVICA is infertile and water impermeable, but we use it in potter's trade.

I hope you knew something
new about Slovenia...
